Complex numbers Geometry

Definition Geometric interpretation

Definition

Complex numbers have the form a + bi

•
$$(a+bi) + (c+di) = (a+c) + (b+d)i$$

•
$$-(a+bi) = (-a) + (-b)i$$

•
$$s(a+b\mathbf{i}) = (sa) + (sb)\mathbf{i}$$

Complex numbers form a 2D vector space

ヘロト 人間 とくほとく ほとう

₹ 990

Complex numbers Geometry

Definition Geometric interpretation

Multiplication

By definition, $i^2 = -1$:

•
$$(a+bi)(c+di) = (ac-bd) + (ad+bc)i$$

•
$$(a + bi)^{-1} = \frac{a}{n} + \frac{b}{n}i$$
 where $n = a^2 + b^2$

Complex numbers form a field

Definition Geometric interpretation

Polar Form

$$\cos x = \frac{x^0}{0!} - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots$$
$$\sin x = \frac{x^1}{1!} - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots$$
$$e^x = \frac{x^0}{0!} + \frac{x^1}{1!} + \frac{x^2}{2!} + \cdots$$

Introduction Algorithms Problems

Dot And Cross Product

 $\overline{z}w = rs\cos\theta + (rs\sin\theta)\mathbf{i}$

Introduction Algorithms Problems

Dot And Cross Product

 $\overline{z}w = rs\cos\theta + (rs\sin\theta)\mathbf{i}$

int dot(pnt z, pnt w) { return real(conj(z) * w); }
int cross(pnt z, pnt w) { return imag(conj(z) * w); }

ヨト イヨト ヨー つくや

Introduction Algorithms Problems

Signed Triangle Area

```
For convenience, I usually define
int cross(pnt a, pnt b, pnt c) {
return cross(b - a, c - a);
}
```

which is twice the signed area of $\triangle ABC$.

ヘロン 人間 とくほ とくほ とう

Introduction Algorithms Problems

Line-Line Intersection Test

Start with a bounding box test

bool intersects(pnt a, pnt b, pnt p, pnt q) { if (max(a.real(), b.real()) < min(p.real(), q.real())) return false; if (min(a.real(), b.real()) > max(p.real(), q.real())) return false; if (max(a.imag(), b.imag()) < min(p.imag(), q.imag())) return false; if (min(a.imag(), b.imag()) > max(p.imag(), q.imag())) return false

ヘロト ヘアト ヘビト ヘビト

Introduction Algorithms Problems

Line-Line Intersection Test

Check if PQ lies entirely on one side of AB:

int cp = cross(a, b, p); int cq = cross(a, b, q); if (cp > 0 && cq > 0) return false; if (cp < 0 && cq < 0) return false;

and check if AB lies entirely on one side of PQ

int ca = cross(p, q, a); int cb = cross(p, q, b); if (ca > 0 && cb > 0) return false; if (ca < 0 && cb < 0) return false;

Passed all the tests, so the lines intersect

return true;

Introduction Algorithms Problems

Scaled Triangles

Transformation

In complex numbers, this is an affine function

$$f(z) = vz + w$$

where v scales and rotates, w translates

イロト 不得 とくほ とくほ とう

E DQC

Introduction Algorithms Problems

Scaled Triangles

Finding The Transformation

$$B_2 - A_2 = f(B_1) - f(A_1)$$

= $(vB_1 + w) - (vA_1 + w)$
= $v(B_1 - A_1)$

Therefore

$$v=\frac{B_2-A_2}{B_1-A_1}.$$

Also, $A_2 = vA_1 + w$ gives

$$w = A_2 - vA_1$$
