## Subset Selection

Given $N$ sequences, each containing $M$ integers, each of which is between 0 and $B-1$ inclusively. We define the sum of a number of sequences as a sequence with the same length, in which each element is equal to the sum of the elements on that specific position, modulo $\mathbf{B}$.

For example, the sum of the sequences $\{1,4,2\},\{2,2,2\}$ и $\{3,1,3\}$ with $B=5$ is the sequence $\{((1+2+3) \bmod 5)=1,((4+2+1) \bmod 5)=2,((2+2+3) \bmod 5)=2\}$.

The value of a sequence $\left\{A_{1}, A_{2}, \ldots, A_{M}\right\}$ is defined as $\sum_{i=1}^{M} A_{i}^{2}$.
Write a program subsetselection, which chooses a non-empty subset of the $N$ given sequences, such that the value of the sum of the sequences in the chosen subset is as large as possible.

## Input

The first line of the input file subsetselection.in contains three positive integers $-N, M$ and $B$. Each of the next $N$ lines contains $M$ integers, each of which is between 0 and $B-1$, describing the respective sequence.

## Output

On the first line of the output file subsetselection. out print one positive integer $K$ - the number of the chosen sequences. On each of the following $K$ lines print a single positive integer - the input index of the current sequence. Sequences are numbered from 1 to $N$. You can print them in whatever order you wish, but there should not be repeating indices or indices not in the interval between 1 and $N$.

## Scoring

If the output does not fulfill the restrictions above, you will receive 0 points for the test.

Otherwise, you will receive score $\times\left(\frac{\text { yours }+1}{\text { best }+1}\right)^{2}$ points, where score is the number of points the test is worth, yours is the value of the sum-sequence, obtained by you, and best is the maximum value of a sum-sequence among all participants for the given test.

## Subset Selection

## CE3OH 8 - FIFTH ROUND

Embrace The Challenge

Constraints

| Portion of tests | Constraints |
| :---: | :--- |
| $15 \%$ | $N=20, M=20, B \in[2 ; 20]$ |
| $\mathbf{3 5 \%}$ | $N=\mathbf{2 0 0}, M=\mathbf{2 0 0}, B \in[2 ; 100]$ |
| $50 \%$ | $N=\mathbf{1 0 0 0}, M=\mathbf{1 0 0 0}, B \in[2 ; \mathbf{1 0 0}]$ |

Time limit: 5 s
Memory limit: $\mathbf{2 5 6}$ MB

## Sample test

| Input (subsetselection.in) | Output (subsetselection.out) |  |
| :--- | :--- | :--- |
| 5 | 3 | 3 |
| 1 | 0 | 0 |
| 0 | 0 | 0 |
| 1 | 2 | 3 |
| 1 | 2 | 2 |
| 2 | 3 | 1 |$|$|  |
| :--- |

The proposed output will give a result of 12 .
